

What Carbon Masters Learned from Andy Bunn:

- CO2 is a heat trapping gas. If you put it in the atmosphere, it will trap heat.
The simplest solution is usually right
I want to hear more about the arctic
- Amazing to learn the whole concept of greenhouse gases was predicted so long ago and that Arrhenius's model was so accurate
- Change is the fabric of the universe.
- Definition of unicorn technology & simplest answer is usually right.
- This is a waste of energy—Verbal is better.
- Basic History of Climate Change –interesting and I will look into AIP.org for more detail.
- I learned that we emit more CO2 than volcanoes. Also that Climate change deniers may be taking the value judgement personally. Low carbon makes sense to me.
- That ocean's ability to absorb CO2 will slow down & not be able to absorb as much as now.
- The Keeling curve not well explained to me.
- Alternative energy alone can't provide energy needs today. Technology or scale doesn't exist.
- "Baselines" How they were determined and over what extent of time period(s) "eons"
- Alligators in Hudson Bay if you wait long enough.
- There's no monkey under the bed!
